Percentage of Active Children identified as being in Foster Care at the time of Pre Testing 2nd Quarter FY25

18%

Pre and Post Outcomes by Assessment Type

As children are often in services for more than one quarter, pre and post results were analyzed for a the time period of October 1, 2021- December 31, 2024

Infant & Toddler DECA Results

For children having matched pre and post scores:

- Toddler protective factor t-scores **improved** from 41 (borderline area of need) to 46 at post (Typical).
- Infants with matched pre post tests had average total protective factors in the typical range (Tscores of 51), yet still **improved** to 52.

DECA Clinical Results

For children having matched pre and post scores:

- Overall total protective factors **improved** from an area of need to a mean in the typical range. (Mean T-score of 39 to 43 at post). Total behavior concerns also **improved** moving from high area of need to the border of typical. The greatest improvement was seen in withdrawal/depression decreasing from a t-score of 61 (Area of need) to 58 (normal range).
